Individual Case Safety Report (ICSR)

Case Study – Five Required ICSR Steps

Case ID: ICSR-2026-001

Case: A 32-year-old male developed a serious hypersensitivity/anaphylactic reaction after taking amoxicillin 500 mg orally three times daily for acute bacterial sinusitis.

1. TRIAGE

The case is first assessed to determine whether it contains the minimum information required for a valid ICSR and to identify the nature and priority of the report.

Triage item	Case assessment
Identifiable patient	Yes – 32-year-old male, initials AB
Identifiable reporter	Yes – physician
Suspected medicinal product	Yes – amoxicillin
Adverse event	Yes – rash, facial swelling, dyspnoea, wheezing and dizziness
Seriousness	Serious – hospitalization required
Priority	High priority due to serious hypersensitivity/anaphylactic reaction

Triage conclusion: Valid and serious ICSR requiring further processing.

2. DATA ENTRY

The available case information is entered into the pharmacovigilance safety database.

Data field	Entered information
Patient	AB, 32-year-old male, 68 kg
Suspected drug	Amoxicillin 500 mg, oral, TID
Indication	Acute bacterial sinusitis
Therapy start	10-Oct-2026
Therapy stop	12-Oct-2026
Events	Generalized itchy rash, facial swelling, dyspnoea, wheezing, dizziness
Treatment	Adrenaline, antihistamine, corticosteroid, oxygen
Dechallenge	Positive – symptoms improved after drug withdrawal
Rechallenge	Not performed
Outcome	Recovered/recovering; discharged on 14-Oct-2026
Seriousness	Hospitalization
Causality	Probable/Likely

The reported medical concepts would be coded using the applicable current MedDRA version during database entry.

3. QUALITY REVIEW

The completed case is checked for completeness, consistency, accuracy, and data quality before medical review.

Quality check	Finding
Minimum criteria	Present
Patient information	Adequate
Reporter information	Identifiable
Drug information	Adequate
Event information	Adequate
Dates/timeline	Consistent
Seriousness	Hospitalization documented
Dechallenge	Documented as positive
Outcome	Documented
Duplicate check	To be performed according to database/SOP

Quality review conclusion: Case information is sufficiently complete and internally consistent for medical review.

4. MEDICAL REVIEW

A medically qualified reviewer evaluates the clinical information, seriousness, causality, expectedness, and overall medical interpretation.

Medical assessment	Conclusion
Clinical event	Severe hypersensitivity/anaphylactic-type reaction
Seriousness	Serious – hospitalization
Severity	Severe
Dechallenge	Positive
Rechallenge	Not performed
Causality	Probable/Likely
Expectedness	Expected/Listed for this training case
Outcome	Recovered/Recovering

Medical review conclusion: The temporal relationship, known potential for amoxicillin hypersensitivity, positive dechallenge, and lack of a significant alternative explanation support a probable/likely relationship.

5. SUBMISSION

After completion of triage, data entry, quality review, and medical review, the finalized case is prepared for submission/reporting according to the applicable pharmacovigilance procedure and regulatory requirements.

Submission check	Status
Case validity confirmed	Completed
Seriousness assessed	Completed
Medical review completed	Completed
Case narrative/data finalized	Completed
Required regulatory reporting	Determined according to applicable reporting rules
Final disposition	Ready for submission, subject to applicable SOP/regulatory timelines

ICSR PROCESS SUMMARY

TRIAGE → DATA ENTRY → QUALITY REVIEW → MEDICAL REVIEW → SUBMISSION

Final case summary: Valid serious ICSR involving a suspected amoxicillin-associated severe hypersensitivity/anaphylactic reaction. The case is positive on dechallenge and assessed as probable/likely based on the available information.
